
From Siloed Data to Trusted Data Products

Data Enablement in Regulated Finance

Moving Beyond Access to Outcomes

Preeti Gupta

SVP, Enterprise Architecture

Where Many Institutions Are Today

- Legacy systems and fragmented ownership create bottlenecks.
- Significant investments in data lakes and catalogs have improved access.
- Broader access across teams, but governance remains reactive.

“

Access alone has not consistently delivered outcomes.

Reality Check

Access Without Structure Creates Risk

⚠️ Unmanaged Growth of Complexity

- 👁️ Increased data visibility without context leads to misinterpretation.
- 👤 Limited accountability when "everyone" owns the data.
- 📅 Inconsistent definitions across departments create reporting conflicts.
- ⚙️ Manual governance controls cannot scale with data volume.

“

Access can scale chaos if foundations are weak.

_____ The Consequence

From Access to Outcomes

Democratization

Focus on Access

Who can access data

Central approvals & gates

Shared raw datasets

Reactive governance

VS

Enablement

Focus on Value

Who owns the data

Platform guardrails

Domain data products

Embedded governance

“ Data enablement means delivering **trusted, governed, reusable data products** through a scalable platform.

Enablement Requires Platform Thinking

Project Mindset

Platform Mindset

Reusable infrastructure over one-off builds

Standardized onboarding processes

Automated quality checks embedded in pipelines

Guardrails, not gates (compliance by design)

Self-service with centralized control

“

Platforms scale standards. Projects scale exceptions.

Core Principle

Core Components

From Datasets to Data Products

Defined Owner

Clear accountability assigned to a specific domain team or individual, not generic IT ownership.

Business Purpose

Designed to solve specific business problems with documented value propositions.

Versioned Schema

Stable, predictable interfaces with semantic versioning to prevent breaking downstream consumers.

Quality Guarantees

Explicit SLOs for freshness, accuracy, and completeness monitored in real-time.

Usage Metrics

Visibility into who is using the data, how often, and for what purpose to drive lifecycle management.

Compliance Traceability

Automated lineage, audit logs, and access controls built directly into the product definition.

Embedded, Not Bolted On

Automated access provisioning based on policy, not tickets

Built-in policy enforcement at the ingestion and consumption layers

End-to-end lineage automatically captured for every transformation

Audit-ready by design with immutable logs of all activities

Regulatory alignment integrated early in the product lifecycle

Open Source as a Strategic Enabler

-  Interoperability across systems via open standards
-  Transparent standards ensure code visibility and security
-  Community-driven innovation accelerates feature development
-  Reduced vendor lock-in allows for flexible architecture
-  Faster iteration cycles compared to proprietary software

Reuse

Build Once, Use Everywhere

Collaboration

InnerSource & Community

Shared Accountability

Collective Code Ownership

What Leaders Must Do Differently

 **Fund platforms**, not isolated projects, to create reusable infrastructure.

 **Define domain ownership clearly** to ensure accountability for data products.

 **Align compliance early in design** rather than as a final checkpoint.

 **Measure outcomes, not access**, focusing on business value generated.

“

Technology transformation succeeds when operating models evolve.

Core Strategy

Start Small. Scale Intentionally.

Transformation is a journey, not a switch. By focusing on high-value domains first, we demonstrate value early while building the governance foundations needed for scale.

Strategic Focus

Avoid "boiling the ocean." Select use cases where data quality directly impacts revenue or risk.

1

Choose One High-Value Data Domain

Select a pilot domain (e.g., Customer, Risk) with clear business impact.

2

Assign Clear Product Ownership

Designate a Data Product Owner responsible for quality and lifecycle.

3

Build Governance into the Pipeline

Automate policy checks and quality assertions at ingestion.

4

Measure Adoption and Reuse

Track KPIs: API consumption, data quality scores, and time-to-access.

5

Replicate Reusable Patterns

Codify success into templates and expand to adjacent domains.
